

ME-160 WALL STORAGE BRACKETS

Mounting Guidelines:

The ME-160 Wall Storage Brackets are designed for use with a piece of 2"x10" lumber of user chosen length. Due to the different length configurations possible, each installation will be subject to different loads and the mounting method must correspond to the loading.

Each bracket should be fastened to a solid structure, ideally a steel beam, wooden post or a concrete wall. A stud wall can be used, but ensure that the fasteners are centered on the stud and use the outermost mounting holes in each bracket. The fasteners that should be used for mounting include bolts, lag bolts or concrete anchors, because of the various possible attachment materials, no fasteners are included.
